

# Defining Ecoregions and Prototyping on EO-based Vector-borne Disease Surveillance System for North Africa (PROVNA)

- IZSAM – WOAHA Collaborating Center for Epidemiology
- WOAHA Office North Africa in Tunis

Final meeting – PROVNA project – July 2 2024

# Climatic and Environmental variables in vector-borne diseases

Parselia et al. Satellite Earth Observation Data in Epidemiological Modeling of Malaria, Dengue and West Nile Virus: A Scoping Review. *Remote Sens.* 2019, 11, 1862; doi:10.3390/rs11161862

# Earth Observation

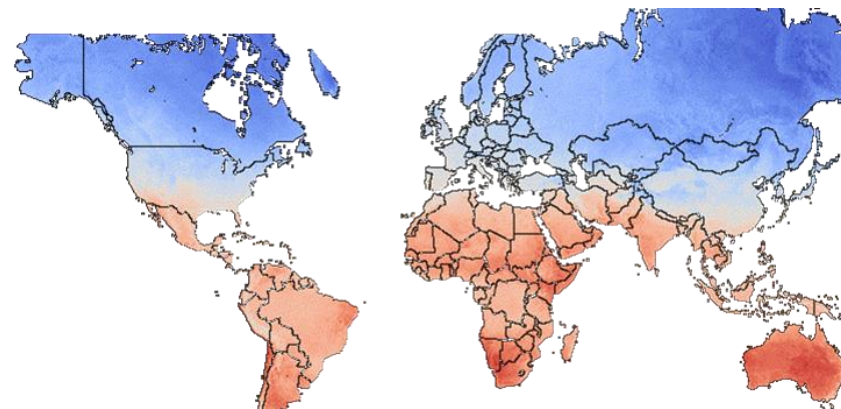

## EO provides:

- **accurate** geo-locations for contiguous target areas;
- **objective**, consistent measurements of physical properties of the Earth and its atmosphere that can be interpreted to define its features and conditions;
- **repeated** coverage to enable detection of changes in features and/or their condition.

## Terra – Aqua satellites

- **Spatial resolution: 250 m, 500m, 1 km**
- **Temporal resolution: 1-2 days**

# Earth Observation data

**Land Surface Temperature**

**Normalised Difference Vegetation Index**

Spatial resolution S-2:  
10 m, 20m, 60m

Temporal resolution: 5  
days

# Copernicus programme

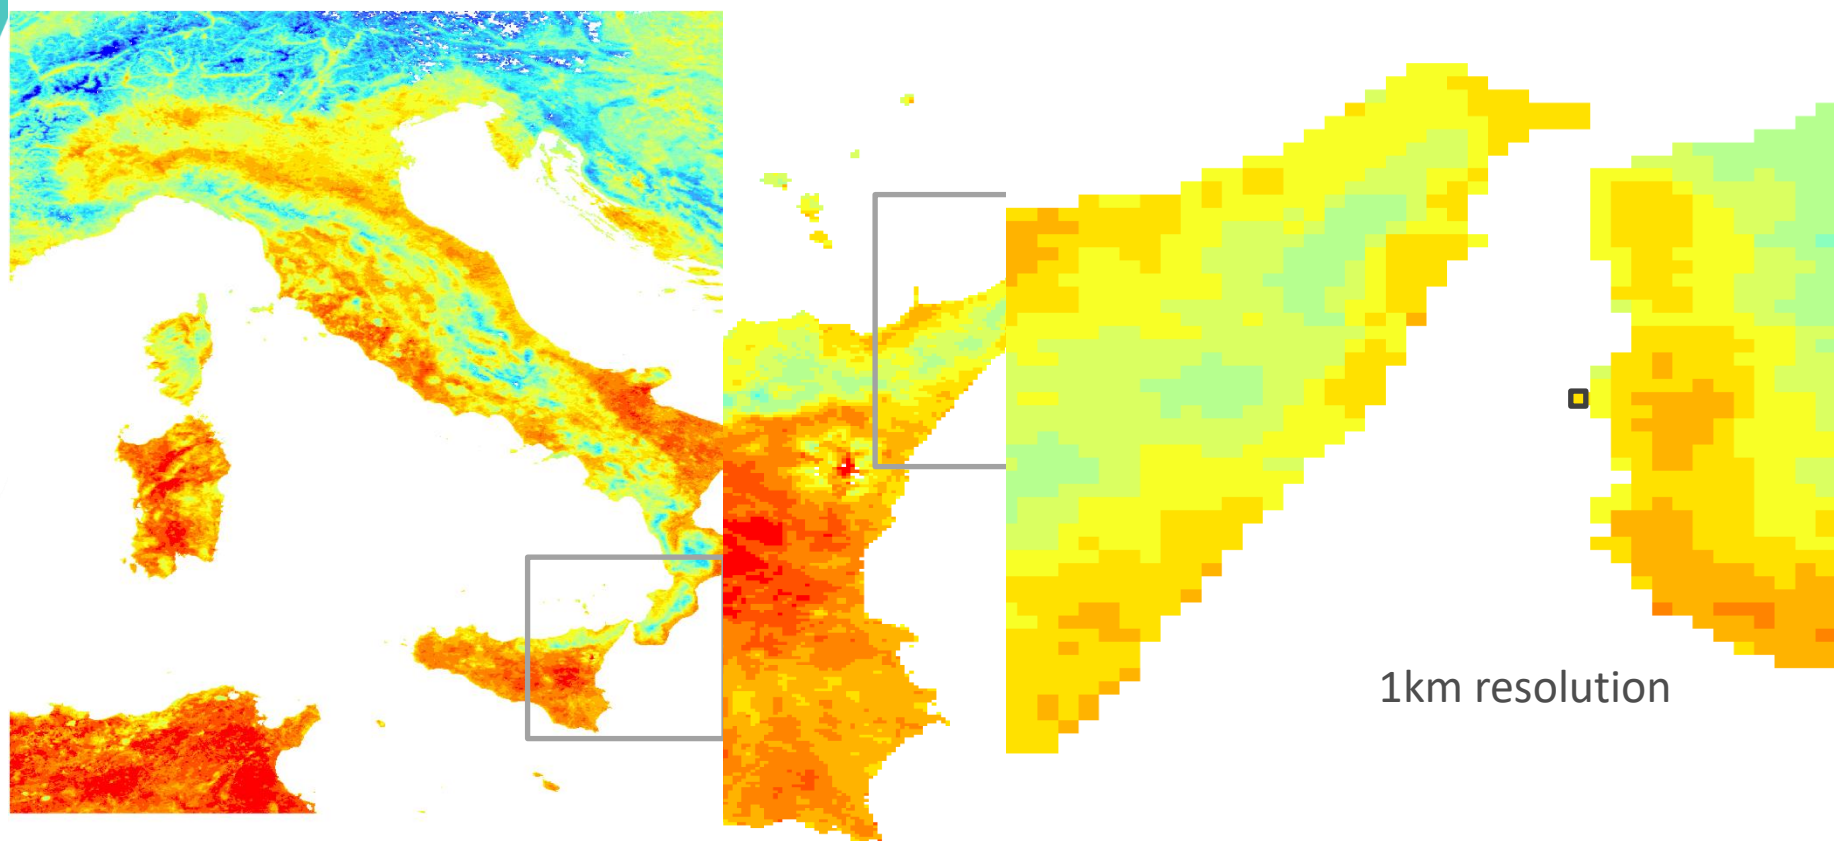

## True color Moisture index NDWI

# Earth Observation data

Temperature MODIS 1 km

# PROVNA project

## *Research objectives*

1. to define the “ecoregions” of the North African territory (Mauritania, Morocco, Algeria, Tunisia, Libya and Egypt), each one characterized by distinct environmental and climatic factors, on the assumption that similar areas (in space and / or time) are subject to similar diseases (especially vector-borne diseases);
2. to build a customised prototype application to identify areas at risk for RVF in North Africa region. This system combines static inputs with other EO-dynamic variables like NDVI, rainfall to demonstrate this capability and use by various Veterinary Services in the region.

## Ecoregionalization

It is the process through which a territory is classified into similar areas according to specific environmental and climatic factors. The climate and the environment strongly influence the presence and distribution of vectors responsible for significant human and animal diseases worldwide. It is then useful to develop a map of similar eco-climatic regions adopting a data-driven spatial clustering approach using recent and detailed spatial data on climatic and environmental factors.

# Area of Interest

26/04/2022

31/06/2024

# Project phases

## Phase 1. Definition of the requirements

*Activity 1.1: literature review*

*Activity 1.2: definition of EO data*

*Activity 1.3: definition of system architecture and statistical analysis*

## Phase 2: EO data preparation

*Activity 2.1: data retrieval*

*Activity 2.2: manipulation and processing of EO data*

## Phase 3: Statistical model/analyses - Ecoregions

*Activity 3.1: Super SOM (Unsupervised Neural Network )*

## Phase 4: Ecoregion map evaluation/validation/application and prototype development

*Activity 4.1: disease data/risk areas and ecoregions comparison*

*Activity 4.2: Web Based Prototype Application Development*

## Phase 5: Communication and dissemination

# Self Organizing Maps – Model result

The 1600 nodes were RGB coded. Each color was assigned to each neuron based on the weight of each variable in the node. The Red channel was reserved to the highest weight of LSTD and LSTN, the Green to NDVI and NDWI and Blue to rainfall and soil moisture

# ECOREGIONS and WNV surveillance

## Conclusion **ECOREGIONS** in North Africa

Ecoregions are useful for Veterinary Services and Authorities to plan targeted surveillance with optimization of human and financial resources.  
In Italy this approach is part of the surveillance process for West Nile.

## What next for **ECOREGIONS** in North Africa

1. To be fully validated we should better define the level of similarity/difference between ecoregions with the help of Countries
2. Integrate field data for vector-borne diseases to better test and compare with where possible

*Thank you*
