WGS: a story started 30 years ago

Whole genome sequencing of pathogens: a new era in microbiology

E. Richard Moxon

Sequencing of DNA has brought about a revolution in biology by making available the immense fund of historical information contained in the genomes of cells. Unicellular organisms appeared some 2 million years before the first primitive algae and over a billion years before the first animals and higher plants. Thus, a sensible and obvious starting point in the sequencing of entire genomes might be to tackle the prokaryotes, the smallest chromosomes that contain all the information that is required for the free-living state. Fred Blattner (University of Wisconsin, Madison, WI, USA) emphasized at the recent Workshop on Bacterial Genome Sequencing (Wellcome Trust Frontiers in Biology Conference) that major funding agencies have been reluctant to support the sequencing of bacterial genomes.

Workshop on Bacterial Genome Sequencing, Wellcome Trust Frontiers in Biology Conference, Broadway, Worcestershire, UK, 23–26 April 1995.

E.R. Moxon is in the Institute of Molecular Medicine and Dept of Paediatrics, University of Oxford, UK. tel: +44 1865 221074, fax: +44 1865 220479, e-mail: richard.moxon@paediatrics.ox.ac.uk

led by Craig Venter and Rob Fleischmann at the Institute for Genomic Research (TIGR) in Gaithersburg, MD, USA, in collaboration with Ham Smith of Johns Hopkins University, Baltimore, MD, USA. The genome sequenced was that of *Haemophilus influenzae*, which was once mistakenly thought to cause epidemics of serious respiratory infections that are now

1.83 million nucleotides of circular double-stranded DNA in less than a year. A crucial factor in the success of the project was the application of a random sequencing approach and computational methods developed by TIGR for large-scale sequencing.

Predictably, most of the *H. influenzae* genome consists of sequences representing potentially functional genes; there are a total of 1749 open reading frames, of which about 1200 have similarity with database sequences. Among these are complete sets of ribosomal proteins with similarity to *Escherichia coli*, and amino-acyl-tRNA synthetases. The encoded proteins have been grouped into functional categories to provide a broad picture of the proportion of the genome that is involved in various cell processes. The *H.*

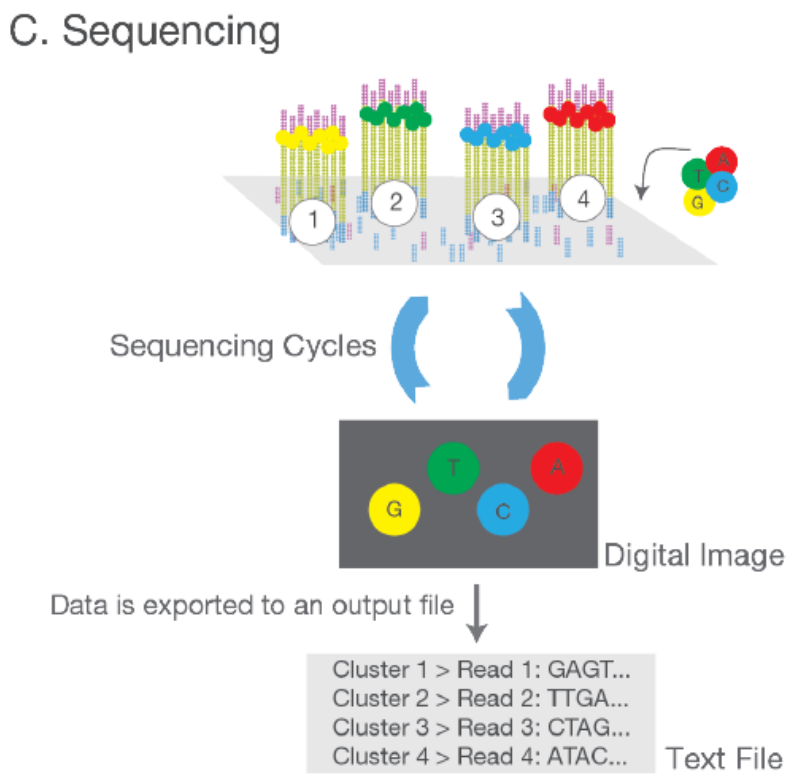
How it works (Illumina NGS technology)

- Microbial WGS has **three basic steps**: library preparation, sequencing, and analysis.
- During **library preparation**, DNA is fragmented; Illumina sequencing adapters linked to each fragment
- Each individual fragment is then **sequenced**
- The resulting nucleotide-level data is **analyzed** to generate an accurate reference genome

IZS
TERAMO
ISTITUTO ZOOPROFILATTICO SPERIMENTALE DELL'ABRUZZO E DEL MOLISE "G. CAPORALE"

Sequencing by Synthesis (SBS)



DNA polymerase catalyzes the incorporation of **fluorescently labeled dNTPs** into a DNA template strand during **sequential cycles** of **DNA synthesis**. All four **reversible terminator–bound dNTPs** are present during each sequencing cycle

During **each cycle**, at the point of incorporation, **the nucleotides are identified by fluorophore excitation**.

IZS TERAMO

ISTITUTO ZOOPROFILATTICO SPERIMENTALE DELL'ABRUZZO E DEL MOLISE "G. CAPORALE"

First step: library preparation

- The sequencing library is prepared by **tagmentation** which combines into a single step the random fragmentation of the DNA or cDNA sample and the adapter ligation reactions
- Adapter-ligated fragments are then **PCR amplified** and bead-based **purified**

Illumina sequencing by synthesis (SBS)

- The critical **difference** with the **Sanger sequencing** is that, instead of sequencing **a single DNA fragment**, **NGS** extends this process across **millions of fragments in a massively parallel fashion**.
- The result is highly **accurate base-by-base sequencing** that virtually eliminates sequence specific errors, even within **repetitive sequence** regions and **homopolymers**.
- More than **90% of the world's sequencing** data are generated by **Illumina** SBS chemistry.

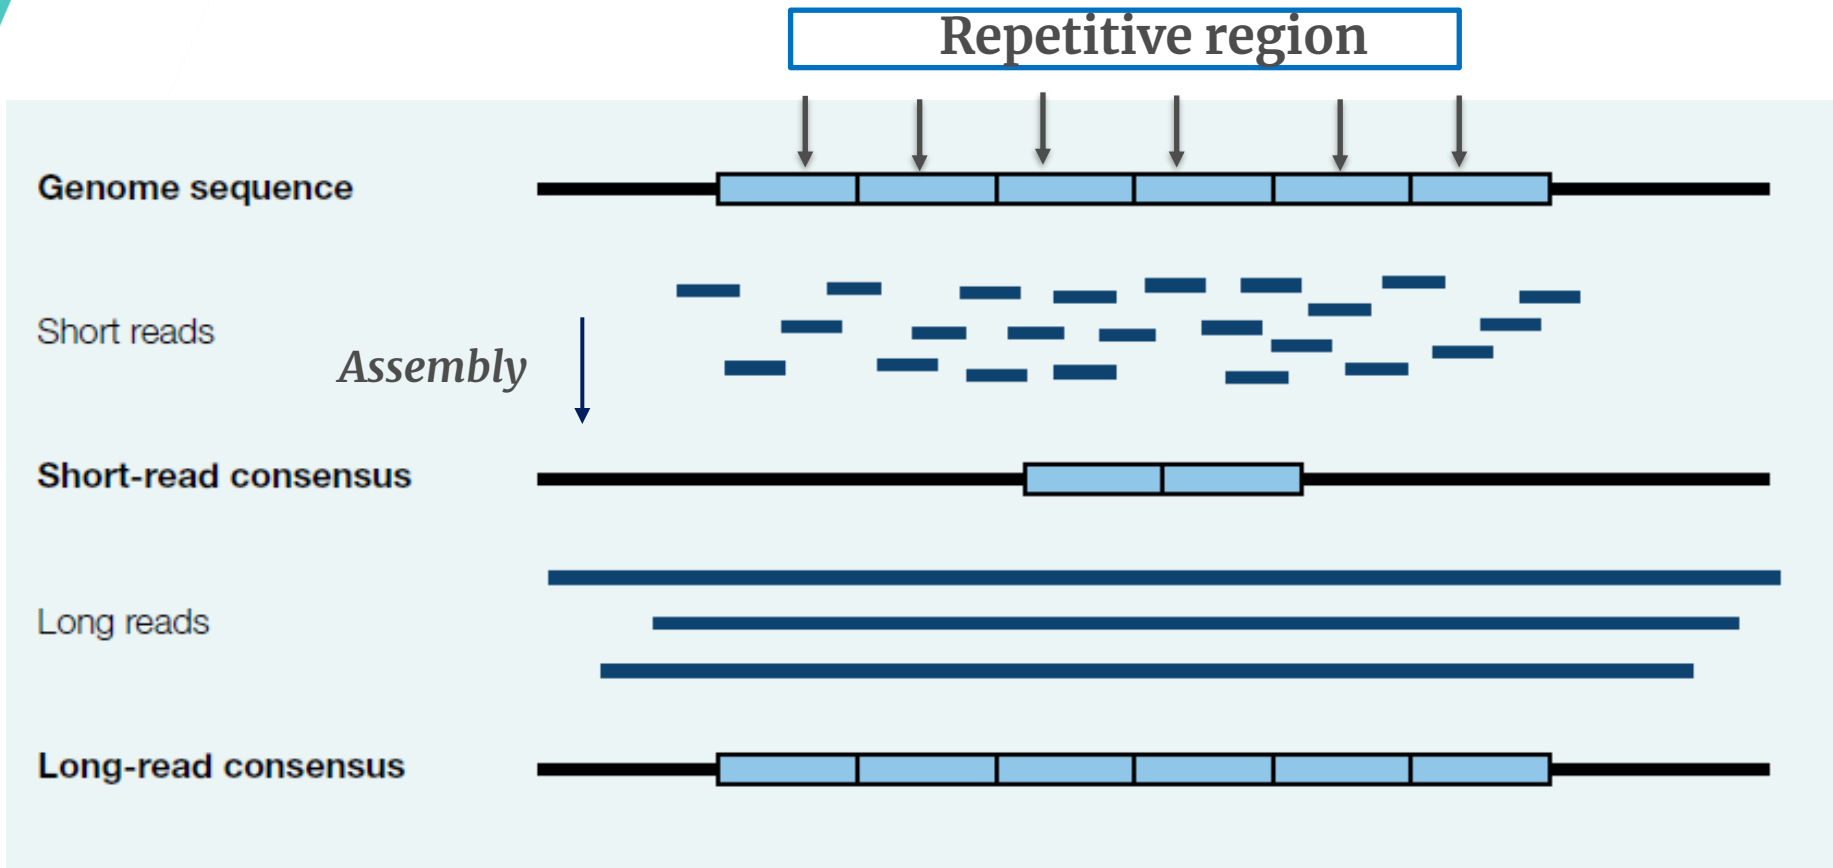
Why long reads?



IZS TERAMO

ISTITUTO ZOOPROFILATTICO SPERIMENTALE DELL'ABRUZZO E DEL MOLISE "G. CAPORALE"

Advantage of Nanopore sequencing

- Using ultra-long nanopore reads it is possible to sequence entire **viral genomes in a single read**, bypassing the requirement for assembly completely
- A significant advantage of nanopore sequencing is that it streams data in **real time**, allowing real-time **data analysis**, which can drastically **reduce time to result**.
- Nanopore sequencing provides additional advantages as **very low capital investment**, and **shorter** (10 hours library preparation and sequencing) **turnaround time** compared to other NGS technologies

Oxford NANOPORE Technologies

IZS TERAMO

ISTITUTO ZOOPROFILATTICO SPERIMENTALE DELL'ABRUZZO E DEL MOLISE "G. CAPORALE"

Why Whole Genome Sequencing (WGS)?

IZS TERAMO

ISTITUTO ZOOPROFILATTICO SPERIMENTALE DELL'ABRUZZO E DEL MOLISE "G. CAPORALE"

Whole Genome Sequencing WGS

Sequencing the entire bacterial, viral or protozoal genomes is important for:

- microbial identification
- comparative genomic studies
- generating accurate reference genomes

Use microbial WGS to:

- **analyze entire genomes and mobile genetic elements** from microbial isolates and cultures
- **discover new variants** in culture or clinical samples
- **investigate** and understand **outbreaks of** infectious disease **or antibiotic resistance**

IZS
TERAMO
ISTITUTO ZOOPROFILATTICO SPERIMENTALE DELL'ABRUZZO E DEL MOLISE "G. CAPORALE"

WGS for molecular typing

- Whole-genome sequencing (WGS) provides higher resolution and accuracy than traditional molecular typing methods (e.g. PFGE, MLVA) for foodborne bacterial pathogens.

- It can be considered a very useful tool in surveillance of FBD and **outbreak investigation**, facilitating the detection of potential clusters and increasing the chance of finding the outbreak source

IZS TERAMO

ISTITUTO ZOOPROFILATTICO SPERIMENTALE DELL'ABRUZZO E DEL MOLISE "G. CAPORALE"

Comparative analysis between conventional microbiological methods and WGS

Aspect	Conventional Methods	Whole Genome Sequencing (WGS)
Principle	Based on phenotypic traits such as culture characteristics, serotyping, biochemical tests, or PCR-based detection (Oluwaseun et al., 2018; Foddai and Grant, 2020).	Sequencing the entire genome to identify pathogens and analyze genetic traits (Allard et al., 2019; Collineau et al., 2019).
Applications	Detection, identification, and enumeration of foodborne pathogens (Martinović et al., 2016; Oluwaseun et al., 2018).	Outbreak tracing, source attribution, evolutionary studies, and functional gene analysis (Baert et al., 2021).
Speed	Time-consuming (days to weeks, depending on the method) (Gill, 2017; Foddai and Grant, 2020).	Faster results once sequencing infrastructure is established (hours to days) (Scarano et al., 2024).
Sensitivity and Specificity	Varies; dependent on culture conditions and the detection method used (Oluwaseun et al., 2018; Foddai and Grant, 2020).	High sensitivity and specificity due to genome-wide analysis (Kovac et al., 2021).
Data Output	Qualitative or semi-quantitative results (e.g., presence/absence, counts) (Foddai and Grant, 2020; Saravanan et al., 2020).	Quantitative and comprehensive genetic data (e.g., SNPs, resistome, virulome) (Franz et al., 2016).

IZS TERAMO

ISTITUTO ZOOPROFILATTICO SPERIMENTALE DELL'ABRUZZO E DEL MOLISE "G. CAPORALE"

Comparative analysis between conventional microbiological methods and WGS

Aspect	Conventional Methods	Whole Genome Sequencing (WGS)
Cost	Lower initial and operational costs (Gill, 2017; Foddai and Grant, 2020).	High initial cost for sequencing equipment; operational costs depend on scale and throughput; these elevated costs may limit some developing countries, or countries with fewer resources, from accessing this technology (World Health Organization, 2018).
Advantages	Cost-effective, well-established, and simple to implement in basic labs (Gill, 2017; Foddai and Grant, 2020).	Provides comprehensive genetic information, including antimicrobial resistance and virulence factors (Allard et al., 2019; Collineau et al., 2019).
Disadvantages	Limited accuracy in strain differentiation and inability to detect non-culturable organisms. Relies on viable pathogens; may not detect viable but non-culturable (VBNC) cells or unculturable pathogens (Gill, 2017; Foddai and Grant, 2020).	High initial cost requires advanced infrastructure, expertise, and bioinformatics capabilities; requires high-quality DNA and generates large datasets that need robust bioinformatics pipelines for analysis (World Health Organization, 2018; Brown et al., 2021).

Italian National Reference Center for Whole Genome Sequencing of microbial pathogens: database and bioinformatic analysis

Italian Ministry of Health
Regulatory reference 30 May 2017
(G.U.R.I. n. 196 23 August 2017)

IZS TERAMO

ISTITUTO ZOOPROFILATTICO SPERIMENTALE DELL'ABRUZZO E DEL MOLISE "G. CAPORALE"

Mission

- To develop a **national platform** for collection and storage of **genomic sequences** of pathogenic microorganisms, to perform **bioinformatic analyses**, to archive and to share the results
- To create a structured and permanent **network of reference people** from all veterinary public health institute (IIZZSS), National Health Institute (ISS) and other research institutes

IZS TERAMO

ISTITUTO ZOOPROFILATTICO SPERIMENTALE DELL'ABRUZZO E DEL MOLISE "G. CAPORALE"

Why a National Platform

- The use of genomic data without a national repository would result in data loss and decrease of **efficiency of national surveillance plans**
- **Setting** of **quality standards** of data obtained by NGS would ensure armonization of bioinformatic analysis
- Capability to **integrate WGS data** with information present in **other national databases**

Using NGS directly from biological samples

- **Targeted resequencing** (amplicon o enrichment based): when the target microorganism is present or at least suspected
- **Metagenomics:** (metabarcoding) it allows many different species to be identified simultaneously in a single sample (e.g. microbial communities)
- **Shotgun metagenomics :** it allows all DNA molecules present in the sample to be sequenced
